Data Navigator

Pulling data from multiple sources produces challenges in rationalizing IT asset information into a single version of truth. Data Navigator from License Dashboard, eliminates the hurdles organizations face and presents normalized and reconciled deployed IT asset information.

Sharing information between systems can become a time consuming and expensive task. We have found that customers are struggling to populate systems with the data gathered from their multiple discovery and inventory solutions. Many organizations have something in place, but it is usually raw data that is collected, making it difficult to provide a clear view of what assets and software are deployed, and identify their associated license liability.

Organizations either face spending a lot of time preforming manual tasks to filter, categorize, group and add the information – an on-going process as the organization doesn't stand still – or spend tens of thousands on a tool that can integrate specific systems.

Introducing Data Navigator

Data Navigator is a product that customers can use as an integration solution between discovery, inventory and third party (CMDB, Service Desk or ITSM) systems. By connecting to the technical solutions and data repositories you have in place, Data Navigator enables you to schedule a process to gather, normalize and rationalize the data, making it available for consumption by third party solutions.

Data Navigator automatically gathers your hardware and software information, then, utilizing our extensive product dictionaries, identifies the deployed assets across your IT estate. The system creates a single source of reconciled IT asset information.

This By collecting IT asset information, Data Navigator helps organizations to understand their deployed asset baseline, verify their data quality and range of coverage. Resulting in the ability to proactively manage any concerns by establishing the trends across multiple inventory sources.

Data Navigator is quick, powerful and can process data for any sized organization, it ensures customers are optimizing their ITAM investments.

BUSINESS BENEFITS

- Add connections to deployed discovery and inventory solutions
- Validate connections to confirm successful configuration
- Create a schedule to define the frequency of the data collection
- Automatically update software recognition dictionaries
- Normalize and rationalize gathered inventory data
- Track and assess inventory coverage via the user interface
- Access the resulting data from third party solutions
